Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SXCCCCCCCCCCCCCCCCCCXXXXTTTTXXXXIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            genes. This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides are cureful for preventing, treating or ameliorating medical conditions, compared the preventing treating or ameliorating medical conditions can be considered by protein or gene therapy. Also pathological conditions can be compared by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new genes. Specific cores are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the claimonst or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, developmental abnormalities autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive clisorders, atherosclerosis, diabetes, cardiovascular disorders, skiney clisorders, atherosclerosis, diabetes, cardiovascular disorders. Widney clisorders, atherosclerosis, diabetes, cardiovascular disorders. The sequences shown in AAY76224 to AAY76424 represent fragments of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the prin specification, but was obtained in electronic format directly from WI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention sample with a binding agent that binds to the proteins of the invention
                                                                                                                                  Immunosuppressive; allograft rejection; topological parameter; physico-chemical parameter; in silico screening; pharmaceutical; cosmetic; agrochemical; biomaterial; veterinary application.

                                                                                                                                                                                            The present invention relates to a method for identifying physico-chemical and/or topological parameters associated with biological activity. The method involves selecting the first subset from predetermined set of physico-chemical parameters, determining their value of function, and selecting the second subset from physico-chemical parameters based on the values of function, such that each second subset is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria for screening candidate molecules and are suitable for use in silico screening of compounds. The compounds may be used in pharmaceuticals, cosmetics, agrochemicals, biomaterials and in veterinary applications. It is also useful as an antibiotic or antifungal agent. The present sequence is an immunosuppressive peptide, Pls, identified by in silico screening. The immunosuppressive peptide, pls, identified by in silico screening. The immunosuppressive activity of the peptide that prevents allograft rejection is tested in a heterotopic allograft model of mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

Printibiting carrivation of pytocoxic Typubpocytes and/or matural killer cells with compound comprising oil goopeptide

Mitch contiguous sequence of human leukocyte antigen-B alphal domain -

Claim 12; Column 38; 2009; English

The present sequence of human leukocyte antigen-B alphal domain -

CC inhibiting active the compound till manual and compound tiller

CC comprising an oil goopeptide of at least 6 antion of cits compound tiller

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of cits compound

CC comprising an oil goopeptide of at least 6 antion of colls

CC comprising an oil goopeptide of at least 6 antion of colls

CC comprising an oil goopeptide of at least 6 antion of colls

CC comprising an oil goopeptide of at least 6 antion of colls

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.

The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HIA) -B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.

                                                                                                                                                                                                                                                                         AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched domor. The peptides are administered to a patient in conjunction with a subtherrapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
        Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

```
This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal claimed which has immunomodulating activity, including the N-terminal activated and/or C-terminal amidated or seterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R az76-771) (aa37-84) or (aa64-79) (laa37-768); aa76 = E or y, aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84 = a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and are represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HAA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in viro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLB: They can also inhibit the proteins of interest to activate CTLB: They can also inhibit the proteins of all sin response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumacoid arthitits and lupus erythematosis. The products can also be used for detection and diagnosis.

proteins and polynucleotides may be used in the prevention, diagnosis and example, they may be used to treat disorders associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to puplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK64922 to AAK64950 and AAM81169 represent sequences used in the exemplification of the present invention. 46 AA; Sequence 8888888888888888888888888

New peptide YY analogs especially useful for treating gastrointestinal disorders associated with excess intestinal electrolytes and water secretion, and decreased absorption, e.g. infectious and inflammatory diarrhea

Claim 24; Column 5; 18pp; English.

Sequences AAY87551-Y87564 and AAY87568 represent novel analogues of peptide YY (PYY) that can be used for the treatment of gastrointestinal disorders. PY (AAY87549, AAY87550) is a 36 residue peptide amide that is released into the circulation after a meal and which is thought to play a role in regulating intestinal secretion and absorption. It binds

to a receptor on intestinal epithelial cells, and inhibits intestinal secretion and gut motility. It is therefore a natural inhibitor of diarrhoea. Pry has also been implicated in nutrient uptake, cell corporated in proliferation, lipolysis and vasocomstriction. The compounds of the invention are useful for inhibiting fluid and electrolyte secretion in the sugmenting nutrient transport; increasing cell corporates are useful for inhibiting fluid and electrolyte secretion in the gastrointestinal tract; regulating lipolysis in, for example, adipose tissue; and regulating blood flow in mammals. The canalogues are especially useful in the treatment of gastrointestinal corporated with excess intestinal electrolytes and water corporated with excess intestinal electrolytes and water secretion, as well as decreased absorption. For example, they are useful in treating acute viral or bacterial diarrhoea diarrhoea due to protozoal infections, travellers' diarrhoea; inflammatory diarrhoea (e.g., Crohn's disease, irritable bowel syndrome); short bowel syndrome; or diarrhoea following ileostomy. The peptides can also be used to treat an emergency or life-threatening situation involving a gastrointestinal disorder, e.g., after surgery or due to cholera; and to treat intestinal corporation of the compounds is easier and less costly. The analogues interact specifically with PYY receptors and not with receptors contains the PYY homologue neuropeptide Y (NPY), thus minimising unwanted ö Gaps ö DB 21; Length 10; 12; 0; Indels 55.2%; Scor. 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         process of undergoing cell death, prevent, delay, or rescue the cell from cleath, relative to a corresponding cell into which exogenous nucleic acids have been introduced. The sequences of the invention are useful for diagnosing a protective sequence-mediated condition, disorder or disease in an individual. The treatable disorders are preferably of the central nervous system of humans including ischaemia-related conditions such as stroke, cerebral herniation, septic embolism, cerebral oedema, infections such as meningitis, protozoal infections such as malaria, metazoal infections such as meningitis, protozoal infections such as malaria, metazoal cencephalopathy, conditions involving the eye such as macular degeneration, diabetic retinopathy, trauma such as epidural haematoma, tumours such as primary intracranial tumours, degenerative diseases such as Alzheimer's disease and nutritional, environmental and metabolic conditions. Sequences AMU73255-AMU73378 represent open reading frames of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central
                                                                           Inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells involves combining cells with compound comprising oligopeptide with contiguous sequence of human leukocyte antigen-B alphal domain -
                                                                                                                                                                                                                                                                                                                                                                                                                                Human; human leukocyte antigen-B; HLA-B; immunosuppressive; cytotoxic T cell activation inhibition; cell transplantation; natural killer cell activation inhibition; organ transplantation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0,
```

The present sequence is a peptide which may be used in a method inhibiting activation of cytotoxic T lymphocytes and/or natural

tor killer

ö

```
This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The newel derivatives are linear and lack the genet to an organism, e.g. therapeutic proteins, antibodies for their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cycloplasm and non-live acid.
cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukcyte antigen (HLA)-Balphal domain including amino acids 84-86, where amino acids 84-86 are YYM. The method is useful for transplanting a donor mammalian organ or cells for a mammalian recipient. The organ or cells are compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Linear; protegrin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       - used

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                             AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
administration for current modulate (or inhibit) the a of the patient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   X
Q
                                              CC immunomodulating activity. A peptide-type compound or variant is claimed CC which has immunomodulating activity, including the N-terminal acylated CC and/or C-terminal amidated or esterified forms of up to 60 amino acids, and/or C-terminal amidated or esterified forms of up to 60 amino acids, cCC where the peptide-type compound comprises the formula; A-B, where A, B = CC (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CC (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa84= a hydrophobic or comparise main acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequences related to a Class I HLA-B alphal domain (positions CC amino acid sequences related to a Class I HLA-B alphal domain (positions CC used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in cresponse to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, cused for detection and diagnosis. The products can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptides AAW33784-98 and AAW33778-9 were assayed for their
